348. Design Tic-Tac-Toe

Medium  1229  77  Add to List  Share

Assume the following rules are for the tic-tac-toe game on an $n \times n$ board between two players:

1. A move is guaranteed to be valid and is placed on an empty block.
2. Once a winning condition is reached, no more moves are allowed.
3. A player who succeeds in placing n of their marks in a horizontal, vertical, or diagonal row wins the game.

Implement the `TicTacToe` class:

- `TicTacToe(int n)` Initializes the object the size of the board n .
- `int move(int row, int col, int player)` Indicates that player with id `player` plays at the cell `(row, col)` of the board. The move is guaranteed to be a valid move.

Follow up:

Could you do better than $O(n^2)$ per `move()` operation?

Example 1:

Input

```
["TicTacToe", "move", "move", "move", "move", "move", "move", "move"]
[[3], [0, 0, 1], [0, 2, 2], [2, 2, 1], [1, 1, 2], [2, 0, 1], [1, 0, 2], [2, 1, 1]]
```

Output

```
[null, 0, 0, 0, 0, 0, 0, 1]
```

Explanation

```
TicTacToe ticTacToe = new TicTacToe(3);
```

Assume that player 1 is "X" and player 2 is "O" in the board.

```
ticTacToe.move(0, 0, 1); // return 0 (no one wins)
```

```
|X| | |
| | | | // Player 1 makes a move at (0, 0).
| | | |
```

```
ticTacToe.move(0, 2, 2); // return 0 (no one wins)
```

```
|X| |O|
| | | | // Player 2 makes a move at (0, 2).
| | | |
```

```
ticTacToe.move(2, 2, 1); // return 0 (no one wins)
```

```
|X| |O|
| | | | // Player 1 makes a move at (2, 2).
| | |X|
```
