

Design a Leaderboard class, which has 3 functions:

- 1. addScore(playerId, score): Update the leaderboard by adding score to the given player's score. in the leaderboard, add him to the leaderboard with the given score.
- 2. top(K): Return the score sum of the top K players.
- 3. reset(playerId): Reset the score of the player with the given id to 0 (in other words erase it from the that the player was added to the leaderboard before calling this function.

Initially, the leaderboard is empty.

## Example 1:

```
Input:
```

```
["Leaderboard","addScore","addScore","addScore","addScore","addScore","top","reset","res
[[],[1,73],[2,56],[3,39],[4,51],[5,4],[1],[1],[2],[2,51],[3]]
```

[null, null, null, null, null, 73, null, null, 141]

## **Explanation:**

```
Leaderboard leaderboard = new Leaderboard ();
                             // leaderboard = [[1,73]];
leaderboard.addScore(1,73);
leaderboard.addScore(2,56);
                             // leaderboard = [[1,73],[2,56]];
leaderboard.addScore(3,39);
                            // leaderboard = [[1,73],[2,56],[3,39]];
leaderboard.addScore(4,51);
                             // leaderboard = [[1,73],[2,56],[3,39],[4,51]];
leaderboard.addScore(5,4);
                             // leaderboard = [[1,73],[2,56],[3,39],[4,51],[5,4]];
leaderboard.top(1);
                              // returns 73;
leaderboard.reset(1);
                              // leaderboard = [[2,56],[3,39],[4,51],[5,4]];
leaderboard.reset(2);
                             // leaderboard = [[3,39],[4,51],[5,4]];
leaderboard.addScore(2,51);
                            // leaderboard = [[2,51],[3,39],[4,51],[5,4]];
                              // returns 141 = 51 + 51 + 39;
leaderboard.top(3);
```

## Constraints:

- 1 <= playerId, K <= 10000
- It's guaranteed that K is less than or equal to the current number of players.
- 1 <= score <= 100
- There will be at most 1000 function calls.
